ABVD: six Sulawesi word lists (Muna, Bugis, Makasar, Wolio, Sa'dan Toraja, Tolaki)
1,357 forms for 210 meanings; forms taken as written
Label from ABVD's cognate coding
coded = has a cognate-set number (919)
uncoded = has none (438) (table 1)
25 inputs per form
17 from the written form (length, vowels, glottal mark, letter strings), 8 from the meaning
Counted directly, without the classifier:
profile of uncoded against coded forms,
property by property within lists
(table 5, fig. 5)
Classifier (gradient-boosted trees), scored on forms it has not seen:
five-fold cross-validation, 10 repetitions; one whole list held out
Ranking of uncoded above coded forms (AUC; tables 3–4, fig. 4)
Contribution of each input to the score (model fitted to all forms; fig. 1)
Label crossed with score, with examples (tables 6–7)
Three checks on what "uncoded" means: Makasar against the PMP entry, by meaning (table 2, fig. 3); Tolaki against its subgroup (look-alike screen with a chance control); uncoded forms across lists (permutation test). Spelling tests: glottal conventions (table 8), digraphs, size inputs
